

# 2.4 MegaWatt (MW) Photovoltaic Solar System Woodbridge, New Jersey

## **“Largest Rooftop Solar Installation in US History” -completed by WES Industries**

WES Industries completed the installation of a 2.4 MW Photovoltaic Solar System for our client, BP Solar, in December 2009. The project was valued at over \$18 million. The system was installed atop FedEx Ground's largest hub, located in Woodbridge N.J. (600,000 sq ft. facility, handling 30,000+ packages per hour). We completed the permitting and installation of the system in just over 4 months, during FedEx's busiest time of year without incident or impact to FedEx's operations. The construction timeline was critical based on available state and federal funding opportunities which would have expired at the end of 2009 calendar year. Among our proudest achievements is our safety record; between our men and our sub-contractors, we logged over 40,000 man-hours on this project without a safety incident.

Upon completion, the installation was the largest rooftop array in U.S. History. The project contained major electrical and structural components; our in-house electrical and structural engineering departments as well as our experienced construction project management team made us very suitable to meet the everyday challenges that this project presented. We take pride in knowing that the project was completed on-time and that our client was able to maximize the return on their investment.
